

Dear FCC, In regards to the BPL (Broadband Power Line) transmissions, if granted to electric companies they will generate extreme noise in the radio frequencies from 2 - 20 megahertz which includes many world-wide radio broadcast stations. In this range of frequencies, it would be causing electronic jamming, this is what foriegn countries used to do to us during the "COLD WAR". Likewise, the very important MARS (Military Amateur Radio Systems) operates world-wide by using this range of frequencies, MARS connects together all of the Armed Forces World-Wide. Another point is that it would be superceding the Franchise Agreements that the electric companies presently have with cities and towns, some franchise agreements have addressed this problem in their agreements. This is another way of circumventing the previously agreed franchise fees. This action would also hurt satellite and cable TV companies financally. Please do not forget us small guys, we don't have the funds to fight big power companies.

Yours Truly;  
Bill K. Hoag, K5URM
